

Critical correction required: The current Intro / First Page is not the intended design. I specifically asked for the **Best Text website's original Intro/First Page composition** to be preserved and used as the foundation, then polished—not replaced with a different layout.

The current version has changed the opening structure, visual hierarchy, spacing, typography, and overall composition, and the result is also visually weaker than the original Best Text Intro. The large central logo treatment, oversized “MAIL FACTORY” typography, background treatment, and positioning do not reproduce the original Best Text opening experience correctly.

Please restore the Best Text Intro Page accurately first, including its original composition, hierarchy, visual rhythm, typography treatment, spacing, and overall first-viewport experience. After restoring it, improve the quality carefully without changing its identity.

Do not redesign this section from scratch. Do not use the current version as the visual reference for the Intro. Use the original Best Text Intro as the primary visual source and preserve what was already strong there.

XXXXXX

Important: These four screenshots/elements were provided together only as visual references, not as one combined section. The top two are independent moving/kinetic marquee sections, while the bottom two are separate static editorial compositions. Do NOT merge all four into a single section. Preserve their original behavior and identity. Structure them as separate sections: moving band 1 → moving band 2 → one or more

intervening content sections → static composition 1 → static composition 2. The exact number of intervening sections should follow the original website flow and visual pacing, not the screenshot arrangement.

CRITICAL — DO NOT DESTROY THE ORIGINAL VISUAL.

I asked you to improve the existing “The Mark” section, not redesign or replace it. The previous mailfactory_best_animation_and_visual version already had a strong 3D composition, and that original visual identity must remain the foundation.

The current result is a regression: the original Mail Factory mark geometry, proportions, layered structure, depth, and overall composition have been altered too aggressively, so the section no longer looks like the original high-quality reference. The large solid red geometry shown here is not an acceptable replacement for the original visual.

Correct approach: restore the original The Mark 3D composition first, exactly as it was in the strong reference version. Then improve it non-destructively—better materials, lighting, reflections, shadows, depth, camera movement, reveal choreography, subtle particles, atmosphere, and rendering quality.

Do not replace the original mark geometry, do not create a new logo interpretation, do not flatten the layered structure, and do not change the original composition merely because a different implementation is easier.

Think of this as RESTORE → PRESERVE → POLISH → ENHANCE, NOT REBUILD → REINTERPRET.

The original reference is the visual source of truth for this section. The final result must clearly look like the same original The Mark scene—just more refined, premium, cinematic, and technically polished.

04 — Capability: The cards still look too ordinary and static.

This section needs a significant visual upgrade. Please do not keep the current plain card treatment as-is. Improve both the **card design** and the **card animations** so the section feels as premium and cinematic as the rest of the website.

The four capability cards should have stronger visual hierarchy, depth, spacing, typography, borders/material treatment, hover interaction, reveal choreography, and transitions. The animation should feel intentional and connected to the scroll, not like simple fade-in cards.

Important: Keep the existing content and factual information, but substantially improve the presentation and interaction quality. The cards should feel like a distinctive Mail Factory system interface, not generic website cards. Preserve the overall editorial black/red visual language and make the four-card composition feel visually connected as one system.

Do not replace this with an unrelated layout or a generic SaaS card grid. Improve the existing section while maintaining its identity.

07 — Product Workflow: The card composition and numbering look good, but the decorative red snake-like line in the background is unnecessary and makes the section look noisy and less professional. Please remove this element completely.

Do not replace it with another random decorative effect. The section already has enough visual structure through the cards, typography, numbering, and horizontal movement.

Only add a replacement animation if you can create something genuinely refined, subtle, cinematic, and directly connected to the workflow concept. Otherwise, simply remove the red line and keep the background clean. The goal is **professional visual clarity, not extra decoration or visual clutter.**

Chapter 03 — Dashboard Intro needs a major visual improvement.

The current Dashboard chapter opener feels too empty, flat, and generic. There is a very large unused black area, very little visual storytelling, and the “Chapter 03 / Dashboard” presentation does not feel as polished or cinematic as the Engine intro/chapter opener.

The **Engine intro is visually stronger and should be used as the quality/reference standard for this type of chapter opener**. Please redesign the Dashboard intro with stronger composition, typography scale, spacing, subtle motion, visual hierarchy, and a more intentional transition into the live Dashboard section.

Do not simply add random decorations to fill the empty space. Create a refined cinematic composition that feels purposeful and connected to the Dashboard concept.

Keep the existing Mail Factory editorial visual language, but make this chapter opener feel much more premium, engaging, and professionally designed. The transition from this intro into the real Dashboard should also feel smooth and intentional.

Important: The problem is not that the section lacks effects; the problem is that the composition itself is too empty and visually weak. Improve the composition first, then add only subtle animation that supports it.

09 — LIVE · DASHBOARD: The mobile phone frame MUST be removed permanently.

I have already explicitly instructed multiple times that the website must **NOT use a fake/mobile phone frame or phone mockup for presenting the real application**. This current presentation is still using exactly the type of mobile phone frame I asked you to remove.

Delete this phone frame completely from the final website — permanently. Do not redesign it, restyle it, make it smaller, make it more realistic, or replace it with another decorative phone mockup. It should not exist anywhere in the final implementation.

The real MailFactory application must remain real and functional, but its presentation should use the **actual application viewport/content directly**, with the relevant feature area presented cleanly and professionally. On mobile, use the previously specified **Focused App Viewport crop/mask of the real iframe**, without any fake phone body, bezel, device shell, screenshot frame, or simulated smartphone hardware.

This is a hard requirement, not an optional design suggestion. Search the entire codebase for all phone-frame/device-mockup implementations and remove them from the final website so they cannot reappear in other live-app sections.

Open Factory → Animation: This transition currently looks poor, distracting, and unnecessarily irritating.

The large “OPEN FACTORY →” treatment and its animation do not feel cinematic or refined; it comes across as a basic decorative transition rather than a meaningful part of the experience.

Please **replace this animation with a much more polished, restrained, and purposeful transition** that naturally connects the Dashboard section to the next live application experience.

The animation should feel smooth, premium, and intentional—using subtle motion, strong typography choreography, depth, timing, and spatial transition rather than simply moving oversized text across the screen.

Do not add more random effects or visual noise. The goal is a clean cinematic transition that feels like part of the Mail Factory system, not an advertisement/banner animation.

Preserve the “Open Factory” concept and interaction, but completely improve the animation quality, timing, composition, and transition behavior.

First Run — The Two Messages: Major Layout/Positioning Bug.

There is a huge amount of completely unused space on the right side, while the actual content on the left is being pushed partially outside the viewport. This makes the entire section look broken and unbalanced.

The title, description, and both notification cards must remain **fully inside the visible content area** with proper margins and alignment. Do not position the content so far to the left that text/cards are clipped by the viewport.

Please correct the **container width, horizontal alignment, padding, grid/flex positioning, and responsive behavior** so the section uses the available screen space properly. The large empty area should be intentionally balanced through the composition rather than leaving the content stuck outside the screen.

Important: do not simply scale the content up or move everything randomly. Rebuild the section's spacing and composition so it feels deliberate, centered/balanced, premium, and fully readable at desktop, tablet, and mobile widths. No text or card should ever be clipped outside the viewport.

Engine · Reactor View — Major visual refinement required.

The current Reactor scene is functional, but the **central red sphere, surrounding 3D space, node structures, and information card do not yet feel professionally integrated with the overall Mail Factory visual language**. The central object especially looks like a generic low-poly sphere and feels disconnected from the more refined cinematic direction of the rest of the website.

Central Reactor Core: Please redesign the central object into a more distinctive, premium, system-oriented 3D core. It should feel like an advanced automation/control reactor rather than a basic red geometric ball. Consider a sophisticated layered structure such as an inner energy core + precision shell/ring system + subtle volumetric glow + controlled particle/energy behavior, while keeping it consistent with the Mail Factory black/red editorial aesthetic. The final form should have depth, material richness, precision, and a clear visual relationship with the six engines around it.

3D Environment: The current large flat circular ground/platform and scattered elements make the scene feel more like a generic 3D demo. Improve the entire spatial composition —camera perspective, node placement, depth, lighting, shadows, atmosphere, scale relationships, background space, and connections between the six engines and the central core. The six engine nodes should feel like parts of one coherent engineered system rather than separate objects floating around a sphere.

Motion: Make the camera orbit and node/core interactions more cinematic and purposeful. Introduce subtle synchronized motion between the core, rings, nodes, energy/connection lines, and lighting so the scene feels alive without becoming visually noisy. Avoid excessive particles or random animation.

Information Card: The current floating card is visually weak and looks like a generic UI popup. Redesign it into a much more refined editorial/system information panel with better proportions, typography hierarchy, spacing, border/material treatment, and transition animation. It should feel designed specifically for this Reactor scene, not like a standard website card.

Remove unnecessary instruction text: Completely remove “**Scroll to orbit. Tap a node to read it.**” This text is unnecessary, breaks the visual composition, and does not add useful information. The interaction should be understandable through the experience itself.

Most important: Do not rebuild the whole section into an unrelated concept. Preserve the original Reactor’s six-engine system, functionality, interaction, and cinematic intent, but **substantially improve the visual quality of the core, environment, card, lighting, camera choreography, and overall composition.**

The target is **precise, cinematic, engineered, premium, and visually coherent with the rest of the website — not “more effects.”**

11 — Six Engines: The typography and vector/icon treatment look too generic and unfinished.

The current engine titles, supporting text, spacing, and especially the simple line-vector icons do not feel premium enough for the overall Mail Factory visual system. They look more like standard website UI components than a carefully art-directed cinematic product section.

Please improve the **typography system, hierarchy, spacing, icon/vector design, and overall composition**. The six engines should feel like parts of one sophisticated automation system, not six ordinary cards placed in a grid.

The vector icons should be redesigned/refined into **distinctive, technically precise visual symbols** with consistent geometry, stroke weight, proportions, and animation behavior. Avoid generic stock-style line icons.

Typography should have stronger editorial character: improve scale relationships between engine number, title, status, and description; refine line-height and spacing; and make the large engine names feel more intentional and integrated with the layout.

Add subtle scroll/reveal/hover interaction where it genuinely improves the presentation, but **do not compensate for weak design with unnecessary effects**.

Keep all six real engine names, their real default states, and factual descriptions unchanged. Improve the visual presentation around them so the section feels **high-end, precise, engineered, and consistent with the best parts of the original references**.

13 — LIVE · ENGINE: The embedded mobile/device frame must be removed. This is a fundamental presentation mistake.

I have already explained that visitors may open this website from an actual mobile phone. Showing the real application inside another fake mobile/device screen creates a “**phone inside a phone**” experience on mobile, which is visually wrong and makes no sense from a UX perspective. It also looks unnecessarily awkward even on desktop because the large device frame dominates the composition and makes the live application feel like a mockup.

You may use the real application’s specific region directly—for example, extract/crop the relevant visual area from the real [mail-factory.html](#) using its actual HTML/CSS/JS and present that region cleanly inside the website. A carefully cropped real app viewport is acceptable, and the crop can be positioned, scaled, masked, or animated to create a premium composition.

But **DO NOT place the real app inside a phone mockup, device bezel, smartphone shell, fake screen, or another simulated mobile container.**

On desktop, the real app region can be presented as a refined editorial/live-app composition that integrates naturally with the page. On mobile, it should simply become an appropriately sized real app viewport/crop that belongs to the website itself—not a mobile device shown inside the visitor’s mobile device.

Please apply this rule to **ALL LIVE APP sections**, not only Engine: Dashboard, Engine, Generator, Library, One Touch, Settings, and every other place where the app is presented.

Important: You are allowed to selectively crop/expose only the relevant portion of the real app and use its real CSS/JS behavior where needed. The application itself must remain

real and functional. The goal is to make the website feel like it is seamlessly presenting the actual product—not displaying a fake phone mockup of it.

14 — SWITCHBOARD: This section needs a substantial visual and layout refinement.

The overall section is currently **far too small for the available viewport**. There is excessive empty space around the main content, so the page does not feel intentionally composed or visually immersive. The left-side heading and right-side engine table should occupy the viewport with a stronger sense of scale, proportion, and balance.

Lighting/background treatment is also weak. The current grey/washed lighting makes the section lose the premium black/red Mail Factory atmosphere and looks visually disconnected from the stronger surrounding sections. Refine the lighting, contrast, background texture, and subtle depth so the section feels intentional and cinematic without becoming noisy.

The buttons/status controls also look poor and generic. Their current visual treatment does not match the rest of the website. Redesign the controls with better proportions, typography, spacing, border treatment, active/inactive states, hover/focus behavior, and subtle interaction feedback. They should feel like part of a sophisticated system interface rather than ordinary HTML buttons.

Please improve the **entire composition together**—section scale, grid proportions, typography, lighting, table presentation, controls, spacing, and responsive behavior.

Do not simply enlarge everything. Recompose the layout so the available viewport is used deliberately, while preserving the real six-engine data and existing functionality. The final result should feel **larger, stronger, cleaner, more cinematic, and significantly more professional**, while remaining consistent with the best visual language of the original references.

Generator — Single / Batch: The entire section currently feels visually weak and unfinished. The typography, oversized “SINGLE.” / “BATCH.” treatment, spacing, control visualization, composition, and overall hierarchy do not feel professionally art-directed. The huge text dominates the viewport without creating a meaningful visual experience, while the small control panel below feels disconnected and more like a placeholder than an integrated product visualization. **Please redesign this entire section, not just individual elements.** The Single and Batch states should feel like two parts of the same sophisticated Generator system, with a strong relationship between typography, controls, motion, and the real application. The large SINGLE/BATCH typography can remain as a conceptual direction, but it needs a much more refined composition, scale relationship, positioning, transition choreography, and visual treatment. It should feel intentional rather than simply oversized text placed in the center. The current miniature control graphic should also be substantially improved or replaced with a more meaningful, polished visualization that actually communicates the Generator behavior. It should not look like a generic placeholder panel. Improve the **section composition, typography, spacing, mode transition animation, control visualization, depth, subtle lighting, and overall storytelling.** Make the Single → Batch transition feel cinematic and connected to the product workflow.

Do not add random decoration or excessive effects. The priority is strong composition and professional art direction. Use the best visual ideas from the original Best Text / Best Animation references where appropriate, while keeping the real Generator behavior and factual content intact.

This section should ultimately feel like a **premium product experience explaining a real generator system**, not a large heading with a small demo box underneath.

Production Line / Generator 3D: The current direction is much better, but the entire scene can still be taken to a significantly more cinematic and professional level.

Layout: Improve the overall composition and camera framing. The conveyor currently stretches across the viewport in a fairly flat way; create stronger depth, perspective, scale hierarchy, and a more intentional focal point so the scene feels like a real cinematic production environment rather than a 3D conveyor placed on a large plane.

3D Space: Make the environment richer and more cinematic through better camera choreography, lighting, depth, atmosphere, subtle volumetric effects, controlled reflections, shadows, and spatial layering. The six stations, conveyor, generated items, background, and environment should feel like one coherent engineered space.

Animation: The full production-line animation should feel more alive and sophisticated. Improve the movement of the items, camera tracking, station activity, lighting responses, and transitions so the animation tells a visual story rather than simply moving objects along a conveyor.

Typography / Text: The current informational text also needs refinement. Improve its positioning, hierarchy, scale, spacing, readability, and relationship with the 3D scene. The text should feel integrated into the cinematic composition instead of sitting on top of the scene as a separate UI element. Make the labels and counters feel intentional and premium. **Important:** Do not replace the existing Production Line concept or destroy the current 3D animation. **Preserve the original concept and working animation, then elevate it** through composition, camera, materials, lighting, environment, motion choreography, and typography. The target should be **cinematic, precise, immersive, premium, and visually believable**, while still remaining performant and coherent with the rest of the Mail Factory website.

16 How to use · from the app's Help Four Steps / How to Use — Major visual redesign required. This section currently looks unfinished, unbalanced, and much weaker than the quality level of the rest of the website.

The problem is not one small detail—the **entire composition is weak**. There is an enormous amount of empty space, the main heading is isolated at the top-left, the “1. Go to Single or Batch Generator” line is floating awkwardly in the middle, and the actual step cards are pushed far down and occupy only a small portion of the viewport.

The step-card carousel itself also looks poor: the cards become unnecessarily tiny and distorted as they move into perspective, the depth effect does not feel premium, and the overall arrangement feels more like a generic 3D carousel than a carefully designed editorial experience.

Please redesign the whole section composition from the ground up while preserving the actual four-step content. Create a much stronger relationship between

the section title, step numbering, active step, supporting description, card/carousel presentation, and navigation controls.

The four steps should be the visual focus of the section. Use the available viewport properly instead of leaving huge empty areas. Improve the card proportions, typography hierarchy, spacing, perspective/depth treatment, active/inactive states, transitions, and navigation controls.

Do not use the current tiny-card perspective treatment simply because it is animated. Animation alone does not make the design professional. The cards should remain readable, visually substantial, and clearly connected to the active step while transitioning smoothly.

The animation should feel **cinematic, controlled, and purposeful**—not like cards randomly sliding through space. A sophisticated horizontal/stacked/overlapping transition is acceptable, but readability and composition must remain the priority.

Also improve the relationship between the large “**Four steps, in an arc.**” heading and the actual step experience below it so the entire section feels like one intentional composition rather than separate elements placed far apart.

Use the strongest original reference design as the starting point where applicable. Restore any good composition that was lost, then improve it. Do not make the section worse by adding unnecessary 3D effects, random decorations, or excessive empty space.

Final target: a highly polished, editorial, premium “How to Use” experience where the four steps are immediately understandable, visually engaging, readable, and professionally animated on desktop, tablet, and mobile.

17 — PARAMETER BOARD: The current design does not look premium enough and needs a substantial visual refinement.

The functionality and real parameter values can stay exactly as they are, but the **overall visual composition, controls, hierarchy, spacing, typography, borders, selected states, and output readout** need to be redesigned to feel significantly more polished and sophisticated.

The current large rectangular control panel feels too plain and generic. The circular option buttons also look like basic HTML controls rather than part of a high-end system interface. Improve their shape language, spacing, active/inactive states, hover/focus transitions, subtle motion, and relationship to the surrounding layout.

The **Generated Output / Copy All area** should also feel much more integrated and visually important instead of looking like a simple footer row inside a box.

Improve the relationship between the left-side editorial headline/content and the right-side interactive parameter system so the entire section reads as **one cohesive premium composition**, not “text on the left + form on the right.”

Use subtle animation and interaction to make parameter changes feel alive—for example, smooth state transitions, controlled numeric/readout changes, refined selection feedback, and synchronized motion—but **do not add random decorative effects just to make it look complex**.

Keep the actual Generator parameters, values, and behavior accurate to the real application. Do not invent new settings or change the product functionality.

The goal is a **clean, highly polished, cinematic system-control experience** with excellent typography, spacing, visual hierarchy, interaction design, and responsive behavior—not a generic settings form.

18 — LIVE · GENERATOR: AGAIN, THE MOBILE/PHONE FRAME MUST BE REMOVED.

This is the same issue I already pointed out in the previous LIVE · Dashboard and LIVE · Engine sections. **Do not repeat this mistake in any more LIVE APP sections.**

The actual MailFactory application should **NEVER be displayed inside a fake smartphone/device frame**. This current presentation literally shows a mobile screen inside the website, which becomes a **phone-inside-a-phone problem on real mobile devices** and also looks visually awkward on desktop.

Remove the phone/device frame permanently from this section and from every other LIVE APP section. Do not resize it, restyle it, replace the bezel, or create another device mockup.

Use the **real application itself** as the visual material. You may selectively crop the relevant HTML/CSS/JS region from the real `mail-factory.html` and present that actual region directly within the website. It can be carefully positioned, masked, scaled, animated, and composed to look premium.

On desktop, integrate the real app region naturally into the editorial layout. On mobile, the real app region should become a proper responsive viewport/crop that belongs to the page itself—not a smartphone shown inside the visitor's phone.

This is a global hard rule: Dashboard, Engine, Generator, Library, One Touch, Settings, and every other LIVE APP presentation must follow the same principle. Search the whole codebase and remove all phone/device mockup implementations before continuing.

19 — FEATURE STORY: This section needs a significant visual and premium-quality refinement.

The overall composition is currently too plain and does not feel as polished or cinematic as the stronger sections of the website. Please improve the **layout, typography hierarchy, spacing, content presentation, feature grid, visual depth, and overall storytelling** so this section feels like a deliberate premium product-story section rather than a standard two-column content block.

The **feature content/cards** should also be visually stronger and more refined. Improve their proportions, borders, spacing, typography, transitions, and subtle interaction so they feel integrated into the Mail Factory design system.

Most importantly, the moving “TIP” bar at the bottom needs to be redesigned. In the reference images I provided, the upper moving band has a much stronger, more distinctive editorial/kinetic treatment. I want the **TIP bar to use that same visual language and quality level**—a proper continuous marquee/kinetic strip with strong typography, spacing, separators, rhythm, and smooth movement.

Do **not** simply keep the current thin line with small “TIP” labels moving across it. That treatment looks weak and unfinished. The TIP information should become a visually intentional moving band that feels like part of the main page system, similar in character to the stronger moving strip reference shown above.

The moving band should have the same kind of **scale, rhythm, typography treatment, spacing, and continuous flow** as the reference, while still containing the actual TIP content. It should feel premium and cinematic without becoming noisy.

Important: The two screenshots were provided as visual references, not as instructions to merge unrelated sections. Use the reference specifically to understand the desired **moving-band design language**, then adapt that language properly to this section.

Preserve the real feature information and honest content, but substantially improve the visual execution. The final result should feel **editorial, cinematic, premium, and professionally art-directed**.

06 — LIBRARY: The overall visual direction is good, but the text composition/layout is seriously broken and must be fixed.

The first screenshot shows that the **main title is already being clipped at the bottom**, which immediately breaks the section hierarchy. In the second screenshot, the problem becomes much clearer: the two editorial text columns on the right are **far too narrow**, causing normal sentences to break into one or two words per line and, in some places, words to visually run together.

For example, text is rendering like **“The Library is the archive of the product...”** as extremely narrow vertical lines, while **“It is deliberately quiet...”** is suffering from the same problem. This is not a stylistic choice—it makes the content difficult to read and makes the entire section look broken.

Fix the actual layout system: increase the usable text-column width, correct the grid/column proportions, remove incorrect max-width constraints, fix padding/margins, line-height, word-spacing, letter-spacing, and responsive breakpoints, and ensure the title and body copy remain completely inside the viewport.

The two-column editorial text should read as **normal, well-composed paragraphs**, not narrow vertical columns. Maintain the intended emphasis on phrases such as **“All Generated Accounts,” “marked LIVE,” “SINGLE record,” and “BATCH.”**

Also fix the title so **“Everything you generate stays here.”** is fully visible and never clipped.

Keep the good parts of this section—the light Library treatment, large open space, red circular visual, and editorial concept—but repair the typography and composition so the whole section feels intentional, spacious, readable, and premium.

Do not solve this by simply shrinking the text. The correct solution is to fix the layout and give the content the proper horizontal space it needs. The final section must be checked at desktop, tablet, and mobile sizes to ensure there is no clipping, over-compression, or broken word wrapping.

20 — ARCHIVE · Sample Records: This page does not look professional enough in its current form and needs a substantial visual refinement.

The basic archive-grid concept is good, but the current execution feels like a collection of plain dark cards placed on a light background rather than a carefully designed premium product/archive experience.

The **card proportions, spacing, typography, empty space inside each card, labels, timestamps, bottom metadata, borders, and hover treatment** all need refinement. The cards contain too much unused empty area while the actual information is compressed toward the bottom, which makes the composition feel awkward.

The current light background also feels visually disconnected from the rest of the Mail Factory experience. Improve the **background treatment, contrast, depth, subtle texture, and relationship between the archive cards and surrounding page** while preserving the Library-specific light visual identity.

The “**TOTAL IN THIS BUILD — 258**” panel also feels like a generic large box. Redesign it so it becomes a stronger visual anchor for the archive section, with better scale, typography, hierarchy, and integration with the surrounding records.

The archive records themselves should feel more like **real designed record objects**: stronger hierarchy between SINGLE/BATCH, account information, timestamp, record metadata, and copy controls; refined hover/interaction states; and subtle animation that gives the cards life without adding unnecessary effects.

Important: keep the actual sample-record data and factual information intact. Improve the presentation, not the facts.

The final result should feel like a **premium digital archive / record system**, with deliberate editorial art direction, sophisticated spacing, strong typography, refined interaction, and visual consistency with the rest of the website—not a normal card grid.

23 — LIVE · LIBRARY: The mobile/device frame must be removed here as well. This section is still using the same phone-inside-website presentation that I have already explicitly asked you to remove. **Do not use any smartphone/device mockup, bezel, frame, or simulated screen anywhere in the final website.** The Library itself is a real part of the application, so present the **actual Library interface directly**. You may use a carefully selected/cropped region of the real mail-factory.html and use its actual HTML/CSS/JS to show the relevant Library area cleanly inside the composition. The current huge phone frame also dominates the desktop layout unnecessarily. Replace it

with a **clean, integrated live-app presentation** that works naturally on desktop and then adapts properly on tablet/mobile. On a real mobile device, the user should see the actual Library viewport—not a phone containing another phone. Keep the strong **“Dark archive, light room.”** editorial concept on the right, but improve the relationship between the text and the real app presentation so the whole section feels balanced and premium.

Global rule: apply the same solution to every LIVE APP section. Search the entire project and remove all device/phone-frame implementations rather than fixing them one section at a time.

One Touch — Feature Story: The core click interaction is good and should be preserved, but several surrounding elements are hurting the visual quality.

First, remove the explanatory text on the lower-right completely:

“A simulated connection surface — the app labels its list ‘22 DEMO SERVERS’...”

This copy adds unnecessary visual weight, and it is not helping the composition.

Second, the **large card at the bottom-left (“EMERGENCY STOP / Closes the simulated tunnel...”)** does not look good in its current position or treatment. Please remove this card from the bottom-left. There is a large amount of unused space in the upper-right area; a refined information element can be placed there instead if the interaction genuinely needs an accompanying explanation. Otherwise, keep the scene cleaner.

Third, **the white orbital/curved lines around the central One Touch sphere need to be addressed.** They currently look like random decorative lines and make the composition more cluttered and less professional. If they are required for the interaction/scene animation, do not simply keep them at their current prominence—**reduce, refine, or redesign them** so they feel like deliberate system geometry. If they have no meaningful functional or storytelling purpose, remove them entirely.

The current **click interaction and connected/disconnected state animation** are good and **should remain**. Do not remove or simplify that part just because the surrounding visuals are being cleaned up.

The central One Touch visualization should remain the primary focal point. Improve the surrounding composition so it feels **clean, precise, cinematic, and premium**, with fewer unnecessary elements and much stronger visual hierarchy.

Important: do not add new decorative lines/effects merely to replace the removed elements. Every remaining visual element should have a clear compositional or interaction purpose.

24 — TELEMETRY: The page itself looks good, but the card carousel is currently poorly composed and visually unprofessional.

CRITICAL: The existing Telemetry animation must **NOT** be changed. The current page animation, transition behavior, timing, and overall animated storytelling are one of the good parts of this section and must remain exactly as the foundation. You are being asked to **improve the card presentation and visual design around the existing animation—not replace or rewrite the animation.**

Card arrangement: The current cards are not arranged with proper visual balance. I want a **center-focused layered carousel**. For example, with 5 cards total:

2 cards behind/offset on the left + 1 active card in the center + 2 cards behind/offset on the right.

The important rule is that the composition must remain **symmetrical and balanced**. It must never look like there are more cards or visual weight on one side than the other. The active card should always occupy the center/focal position, with two progressively receding cards on each side.

When the user clicks **Previous / Next**, the cards should smoothly reorganize around the new active card: the selected card becomes the center card, while the previous center card moves into the appropriate left/right background position and the remaining cards continue to occupy **2-left + 1-center + 2-right**. The transition should feel continuous and elegant, not like cards simply jumping between positions.

Card design: The cards themselves also need substantial improvement. Their current proportions, borders, spacing, background treatment, typography, internal layout, and overall hierarchy feel generic and unfinished. Redesign the card appearance so it feels like a sophisticated **Mail Factory telemetry/system interface**, with premium spacing, refined materials, strong hierarchy, subtle depth, and clear active/inactive states.

Typography/content placement: The text inside the cards needs to be positioned much more professionally. Improve the relationship between state number, state title, description, telemetry values, labels, and any metadata. Typography must remain consistent with the other premium sections of the website in scale, spacing, weight, line-height, and editorial character.

The center card should clearly feel like the active/focused state, while the four background cards should remain visible enough to communicate the carousel structure without becoming distracting. Use controlled scale, depth, opacity, blur, perspective, and spacing only where they improve the hierarchy.

Do not turn this into a generic card slider. The carousel should feel like one coherent spatial system with the center state as the focal point and the surrounding four states forming a balanced visual field.

Keep the existing telemetry data and functionality accurate. Improve **only the card composition, visual design, typography, positioning, and supporting interactions** around the existing animation.

Final requirement: preserve the existing Telemetry animation; make the cards significantly more beautiful, balanced, premium, and professionally composed, with **2 cards on the left + 1 active card in the center + 2 cards on the right**, maintaining that symmetry throughout every Previous/Next transition.

25 — SELECT COUNTRY / DEMO SERVERS: The section itself is visually strong, but the composition has too much unused vertical space and one unnecessary text element.

First, remove “22 DEMO SERVERS” from the section label completely. The title should simply communicate the country/server-selection concept; this extra count is unnecessary and makes the heading area feel more like a specification label than a premium editorial section.

The main issue is the **large amount of empty space between the heading and the interactive country selector**. The section currently feels stretched vertically without enough visual content to justify that space.

Please use the available viewport more intelligently. **Increase the scale and presence of the main title**, refine its positioning, and bring the country selector into a stronger relationship with the heading. The interactive carousel can be larger, more visually prominent, or composed with additional subtle spatial depth so the section feels intentionally designed rather than simply leaving a large empty area.

The existing **country carousel interaction should remain**, including drag and arrow-key behavior. Improve its scale, spacing, perspective, active-state styling, and transition quality only where needed.

Also make sure **no heading, country name, label, or other text ever appears clipped or partially outside the viewport**. Every text element must feel deliberately placed—not as though it was accidentally pushed off-screen.

Do not fill the empty space with random decorations. The solution should come from stronger composition, typography scale, spacing, and the interactive element itself.

The final section should feel **more substantial, balanced, immersive, and premium**, while preserving the current country-selection concept and interaction.

26 — LIVE · ONE TOUCH: The current presentation still uses the mobile/device-style app frame, so the same fundamental issue remains. Even though this section looks somewhat better than the previous LIVE sections, it still feels like a phone/device mockup placed inside the website, and the composition is not convincing enough at desktop size.

The phone/device frame must be removed here as well. Present the real One Touch application directly using the actual app content/viewport, without a smartphone bezel, shell, or fake device presentation.

At the same time, the **One Touch live-app composition itself needs refinement.** The right-side app area currently feels visually isolated and too narrow compared with the large amount of empty space around it. Integrate the real app viewport more naturally into the page so the relationship between the left editorial content and the live application feels intentional and premium.

Keep the real One Touch interaction and its existing state/connection behavior intact. Improve the presentation through **better scale, positioning, cropping, spacing, lighting, depth, and transition choreography**, not by adding a fake phone frame.

The final result must look natural on both desktop and mobile: on desktop, a premium real-app presentation; on mobile, a properly sized real app viewport/crop—not a mobile screen displayed inside another mobile screen.

Do not repeat the phone-frame solution in any other LIVE APP section. This should be treated as a global presentation rule.

27 — SETTINGS / SYSTEM TREE: There are two clear visual problems that must be fixed.

1. **The title is being clipped.** The “Three groups, fourteen pages.” heading is visibly cut off/partially obscured, which makes the main hierarchy look broken. The title must always remain completely visible with correct spacing, line-height, container sizing, and responsive behavior.
2. **The tree interaction and background effect do not look professional.** Clicking a tree item currently produces a background/highlight effect that feels like a generic glow or visual filter rather than a refined system-interface interaction. It should be much more subtle, intentional, and premium.

Keep the **interactive settings tree and real 14-page structure** intact. The tree itself is a good concept and should remain interactive, but improve its visual execution: node spacing, line weight, hierarchy, typography, active/hover states, click transition, focus state, and overall composition.

When a node is clicked, use a **controlled, elegant visual response**—for example, a precise highlight traveling through the selected branch, subtle illumination, or a restrained state transition. Avoid large background flashes, random glow, blur, or effects that distract from the tree.

The interaction should make it immediately clear **which branch/node is selected and why**, without making the whole background change dramatically.

Also make sure the tree and title remain balanced on the page and do not leave excessive empty space or create visual imbalance.

Do not remove the tree interaction. Improve it. Do not add decorative effects just for the sake of animation. The final result should feel like a refined, high-end system architecture interface consistent with the rest of the Mail Factory website.

28 — APPEARANCE · THEME: REMOVE THIS SECTION COMPLETELY.

This Theme section is not necessary for the final website and should not be kept merely because it already exists.

Delete this entire section from the final website, including its theme-card carousel, related visual treatment, animations, supporting text, and unnecessary navigation references associated with this section.

Do not replace it with another unnecessary section. Keep the overall website flow clean and focused, and make sure removing it does not break navigation, chapter numbering, scrolling, or any required settings functionality elsewhere.

29 — BACKUP · DESTINATIONS: REMOVE THIS ENTIRE SECTION FROM THE WEBSITE.

This Backup/Destinations section is **not needed in the final website** and should be removed completely.

Delete the entire visual section, including the destination circles/cards, backup-specific explanatory text, status panel, interactions, and any decorative elements belonging only to this section.

Do not replace it with another unnecessary section. Keep the website flow clean and focused on the core Mail Factory product story.

Removing this section must not break the actual app's Settings functionality, navigation, chapter system, scrolling, or any other required feature. The real app can still retain its Backup functionality; **only this website presentation section should be removed.**

30 — LIVE · SETTINGS: REMOVE THIS ENTIRE WEBSITE SECTION. This section is not needed in the final website and should be removed completely. Delete the entire **LIVE · SETTINGS** presentation, including the large live-app frame, surrounding explanatory text, and any section-specific visual/animation elements. **Important:** this does NOT mean removing the real Settings functionality from the MailFactory application. The actual app and its Settings system must remain intact. Only this separate website presentation section should be removed. After removal, make sure the remaining navigation, chapter numbering, scroll flow, and all required Settings-related interactions elsewhere continue to work correctly.

31 — SUPPORT: This section needs a clear visual upgrade and should feel much more premium and active.

The current layout is functional but too plain compared with the rest of the website. Improve the **composition, typography, spacing, hierarchy, link presentation, interaction states, and overall visual storytelling** so this feels like a polished Support / Project section rather than a simple list of links.

Very important: there must be NO “COMING SOON” anywhere in this section. I will add the final links later. Prepare every relevant item as an **active, functional link/control** with a proper clickable state and a clean placeholder destination that can be replaced easily later.

Do not make anything appear disabled, greyed-out, inactive, or unavailable simply because the final URL has not been added yet. The UI should already look and behave like a finished active section.

Improve the right-side link rows with stronger hierarchy, clearer hover/focus feedback, refined separators, subtle motion, and a more premium interaction when the user moves/clicks on an item.

The left-side **“Where the project lives.”** editorial composition should also be refined so it balances naturally with the interactive links on the right.

Do not invent fake URLs or fake destinations. Use clearly replaceable link targets/configuration so I can add the real links later. The visual treatment and interaction must already be production-ready.

Final target: **clean, active, premium, interactive, and professionally art-directed**, with no “Coming Soon” state anywhere.

32 — TOPOLOGY / SYSTEM MAP: The interactive tree behavior itself is good and should be preserved. However, the typography and title composition have been significantly damaged.

The first screenshot shows the original/desired visual direction much more clearly: the **large editorial heading and supporting text had proper scale, spacing, hierarchy, and visual balance**. In the current version, the title area has effectively become secondary to the tree and no longer feels like a premium chapter composition.

Do NOT change the existing tree interaction/response. The hover/click path highlighting, active-node response, branch tracing, and overall interactive behavior are good. Keep that functionality and animation intact.

Instead, **restore and polish the title/typography/layout from the stronger reference:** the large headline should have the correct scale, line breaks, position, whitespace, serif/emphasis treatment, and relationship to the supporting text. It should feel like an intentional editorial introduction to the system map, not a small heading sitting above the tree.

Also refine the supporting copy so it is properly sized, readable, aligned, and visually connected to the title. Do not let the tree consume the entire visual hierarchy.

Important: Do not “improve” this section by redesigning the tree again. The tree is the part that is currently working. The main repair target is the **title, text composition, spacing, hierarchy, and overall balance around the existing tree interaction**.

The final result should combine the **strong original typography/composition + the current good tree interaction**, producing one cohesive, premium System Map section.

33 — STORY · THE APP FOLLOWS THE TEXT: This section also needs correction, especially the Settings beat and the repeated mobile/device presentations.

The overall storytelling concept is useful, but the current implementation again relies on the **same phone/device-style app frames** that have already been rejected. This must follow the global rule: **no smartphone/device mockups anywhere in the final website.**

Also, the **BEAT 06 — SETTINGS** story is no longer necessary after removing the standalone **LIVE · SETTINGS** section. Keeping another Settings presentation here creates unnecessary repetition and adds another screen-based block without enough visual value. **Preferred solution:** remove the Settings beat from this story sequence rather than keeping it just to increase the number of beats. The story should remain focused on the strongest product journey: Dashboard → Engine → Generator → Library → One Touch. If you believe the Settings beat is genuinely important to the narrative, then it must be **completely reworked into a strong editorial/system visual**, using the real application content directly and without any phone/device frame. It must add something meaningful to the story rather than repeating the Settings section. The remaining story beats should also be reviewed for visual quality and consistency. Keep the **storytelling/scroll animation itself if it is working well**, but replace the weak device-frame presentation with a clean real-app viewport/crop integrated naturally into the composition. **Do not preserve a section or beat merely because it already exists. Every beat must earn its place visually and narratively.**

BEAT 02 · ENGINE

You check the route.

CONNECTED, a latency in milliseconds, a timestamp.
You leave DNS Tunnel on and Core Boost off.

33 STORY · THE APP FOLLOWS THE TEXT

Screen: ENGINE

09 WORKFLOW

BEAT 03 · GENERATOR

You make a batch of twenty.

Email length 12, password length 16. GENERATE
BATCH. COPY ALL.

33 STORY · THE APP FOLLOWS THE TEXT

Screen: GENERATOR

09 WORKFLOW

BEAT 04 · LIBRARY

The batch is already on the shelf.

You star it, verify two, rename the batch.

33 STORY · THE APP FOLLOWS THE TEXT

Screen: LIBRARY

69 WORKFLOW

REMOVE THIS ENTIRE SECTION — FEATURE STORIES / “Six things worth knowing”.

This section is not needed in the final website. Remove the complete section, including the stacked story cards, navigation arrows/counter, related animations, supporting text, and any section-specific visual elements.

Do not replace it with another unnecessary card/story section. Keep the overall page flow clean and make sure removing it does not break the remaining navigation, chapter numbering, scroll behavior, or animations.

ABOUT SECTION — FINAL IMPLEMENTATION DIRECTION

The current rotating 3D text in the About section is not working well. It overlaps the main content, collides with the heading/body text, and makes the composition feel messy rather than premium.

Remove the rotating 3D text completely. Do not repair, reposition, or redesign that specific 3D effect. Replace it entirely.

PRIMARY VISUAL — MAIL FACTORY ENGINE CODE SHOWCASE

Replace the removed 3D typography with a **premium interactive-looking Code Editor showcase**.

This is a **display-only code showcase**.

It is NOT:

- an HTML editor
- a code playground
- a user coding interface
- a live HTML/CSS/JS preview
- a code-generation tool
- a functional IDE

The purpose is to visually present the **actual Mail Factory engine source code** inside a sophisticated developer-tool interface.

SECTION TITLE

Use a professional title such as:

My First Mobile App

or another equally polished title that fits the About/Author section.

The title should feel editorial and personal, not like a generic programming tutorial.

CODE EDITOR STRUCTURE

The editor must contain exactly **3 tabs**, in this exact order:

1. `GoogleAccountEngine.kt`
2. `IdentityShiftEngine.kt`
3. `network_cycle.cpp`

Each tab represents a real source file from the Mail Factory project.

When the user switches tabs, display the corresponding source code inside the editor.

Use:

- syntax highlighting
- line numbers
- active tab state
- file-type-aware syntax colors
- subtle cursor/selection or code-reveal animation if appropriate
- smooth tab switching
- polished scrolling
- professional typography
- clean spacing

The editor should visually resemble a high-end development environment, but it should remain a **read-only showcase**.

CRITICAL — DO NOT MODIFY THE CODE

The source code below is the exact code that must be displayed.

Do not rewrite, shorten, improve, refactor, rename, correct, translate, simplify, or replace any part of it.

Do not create placeholder code.

Do not generate alternative code.

Do not convert the code into HTML.

Do not change the code simply to make the UI easier to implement.

The code must remain exactly as supplied below.

TAB 1 — GoogleAccountEngine.kt

```
package com.atawurrahmantanvir.mailfactory.engine
```

```
import android.app.Activity
```

```
import android.content.Intent
```

```
import android.net.Uri
```

```
import android.util.Log
```

```
import kotlinx.coroutines.flow.MutableStateFlow
```

```
import kotlinx.coroutines.flow.StateFlow
```

```
// Handles Google account-related Android flows.
```

```
class GoogleAccountEngine(  
    private val activity: Activity
```

```
) {
```

```
    // Used to identify logs in Android Logcat.
```

```
private val TAG = "MailFactory_GoogleAccount"
```

```
// Internal console state.
```

```

    return try {
        postLog("> Opening YouTube Gateway...")

        // ACTION_VIEW asks Android to open content using a suitable activity.
        val intent = Intent(Intent.ACTION_VIEW)

        // Targets a specific activity inside the YouTube package.

```

```

intent.setClassName(
    "com.google.android.youtube",
    "com.google.android.apps.youtube.app.application.Shell\$HomeActivity"
)

intent.data = Uri.parse("https://youtube.com")
intent.putExtra("launch_sign_in", true)

intent.addFlags(
    Intent.FLAG_ACTIVITY_NEW_TASK or
    Intent.FLAG_ACTIVITY_CLEAR_TOP
)

activity.startActivity(intent)

postLog("✓ YouTube flow started")
postLog("💡 Hint: Click 'Add Account' inside YouTube if prompted.")
true

} catch (e: Exception) {
    // Falls back to the standard Android account flow.
    postLog("⚠️ YouTube app not found. Switching to backup...")
    openStandardFlow()
}
}

```

```
// Clears all messages from the console.

fun clearConsole() {
    _consoleLog.value = emptyList()
}
}
```

TAB 2 — IdentityShiftEngine.kt

```
package com.atawurrahmantanvir.mailfactory.engine
```

```
import android.util.Log
import kotlinx.coroutines.Dispatchers
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.withContext

// Main MailFactory engine controller.
object IdentityShiftEngine {

    // Used to identify engine logs in Android Logcat.
    private const val TAG = "MailFactory_Engine"

    // Mutable internal state for console messages.
    private val _consoleLog = MutableStateFlow<List<String>>(emptyList())
```

```

// Read-only state exposed to the UI.

val consoleLog: StateFlow<List<String>> = _consoleLog

// Runs once when the engine is initialized.
init {
    try {
        // Load the native C/C++ library.
        System.loadLibrary("nexus_kernel_bridge")

        Log.d(TAG, "Native Bridge Loaded Successfully")

    } catch (e: UnsatisfiedLinkError) {
        // Handles a missing or invalid native library.
        Log.e(TAG, "FAILED TO LOAD NATIVE LIBRARY: ${e.message}")
        postLog("✗ Error: Native Engine not found!")
    }
}

// Native function implemented in C/C++.
private external fun nativeEngageGhostProtocol(): Boolean

// Adds a message to the engine console.
private fun postLog(message: String) {
    val currentList = _consoleLog.value.toMutableList()
    currentList.add(message)
    _consoleLog.value = currentList
}

```

```
}
```

```
// Clears all console messages.
```

```
fun clearConsole() {  
    _consoleLog.value = emptyList()  
}
```

```
// Runs the engine without blocking the main UI thread.
```

```
suspend fun executeIdentityShift(): Boolean = withContext(Dispatchers.IO) {
```

```
    postLog("🛡️ INITIALIZING MAILFACTORY ENGINE...")
```

```
    postLog("⚡ HANDING OVER TO NATIVE BRIDGE...")
```

```
// Used to measure execution time.
```

```
val startTime = System.currentTimeMillis()
```

```
// Execute the native C/C++ operation.
```

```
val success = try {  
    nativeEngageGhostProtocol()  
} catch (e: Exception) {  
    postLog("❌ Native Operation Error: ${e.message}")  
    false  
}
```

```
val duration = System.currentTimeMillis() - startTime
```

```

if (success) {
    postLog("✅ NATIVE OPERATION COMPLETED (${duration}ms)")
    postLog(" - Bootloader State: MASKED (Green)")
    postLog(" - Hardware ID: RANDOMIZED")
    postLog(" - Play Integrity: BYPASSED (API 25 Fallback)")
    postLog("🚀 MAILFACTORY ENGINE READY.")

    return@withContext true
} else {
    postLog("⚠️ NATIVE OPERATION FAILED.")
    return@withContext false
}
}
}

```

TAB 3 — network_cycle.cpp

```

#include <jni.h>

#include <string>

#include <sstream>

#include <android/log.h>

#include <unistd.h>

#include <cstdio>

#define LOG_TAG "MailFactory_Native_Network"

```

```

```

AUTHOR / ABOUT INFORMATION

Keep the author attribution exactly as:

Atawur Rahman — System Architect & Automation Developer

Present it as a refined signature/author element, not as a large distracting card.

Remove mailfactorylabs.github.io completely.

VISUAL DIRECTION

The overall visual language must match the existing Mail Factory website:

- premium black/red palette
- sophisticated editorial typography
- clean spacing
- sharp developer-tool aesthetic
- subtle motion
- restrained transitions
- excellent readability
- no excessive glassmorphism
- no excessive glow
- no unnecessary 3D effects

The Code Editor should become the **main visual focus of the About section**.

The result should look like a premium presentation of the actual engineering work behind Mail Factory—not a generic coding template.

DOWNLOAD / FINAL CTA SECTION — Major visual cleanup and cinematic refinement required.

The current large white orbital/curved lines around the 3D core are making the scene look cluttered and less professional. **Remove these white orbital lines completely** if they are only decorative. Do not keep them just because they are part of the existing animation. The main 3D object should be the visual focus.

At the same time, **upgrade the entire section to a more cinematic and premium composition**: improve the 3D core, lighting, atmosphere, depth, camera movement, particle field, typography scale, spacing, and relationship between the CTA and the 3D visual. The scene should feel like a strong final climax/reveal, not a generic 3D object surrounded by random lines.

Keep the main **Download for Android** and Share actions functional and visually refined.

Remove these unnecessary text elements completely:

SOURCE ON GITHUB ✓

Android · native · v1.0.0 · Stable · Root powered · Local library

The build link is configured by the site owner (MF_CONFIG.downloadUrl). Until then the button explains itself instead of inventing a URL.

These technical/explanatory strings should not be displayed in the final visual section. The CTA should communicate the product clearly without cluttering the composition with implementation/configuration details.

Important: Do not invent replacement claims or unnecessary metadata. Keep only the information that is genuinely useful to the user at this final stage.

The final Download section should feel like a **clean cinematic ending**: strong typography, powerful 3D focal point, controlled atmosphere, refined motion, clear CTA, minimal clutter, and no unnecessary orbital lines or technical text.

41 — FEEDBACK: Remove this explanatory text completely.

Delete:

“Stored on this device · sent to a configured endpoint if one is set”

This technical implementation note is unnecessary in the visual Feedback section and adds clutter beneath the interaction. The section should remain clean and focused on the actual feedback experience.

Do not replace it with another technical/configuration message. Keep the rating interaction and feedback form, but remove this line entirely from the final website.

BRAND / EMERGENCE — Remove the unnecessary text overlays, but DO NOT damage the existing 3D particle/logo animation.

The current particle-based 3D visual is actually a strong concept and should be **preserved as the foundation**. However, the extra text “**FROM THE PARTICLES OF THE PRODUCT**” and “**THE MARK**” is unnecessary and makes the scene feel more like a presentation slide than a premium final brand reveal.

Remove both of these text elements completely. They should not be replaced with random new text or additional labels.

After removing them, improve the existing particle animation **only where it genuinely makes the scene better**—for example, smoother particle gathering, cleaner logo formation, stronger depth, better lighting/glow, more refined particle density, better camera choreography, and a more cinematic reveal.

Do not replace the existing particle/logo concept, do not change the logo identity, and do not introduce a completely different 3D effect. The current idea is good; it simply needs refinement and cleaner presentation.

The final scene should let the **particle-formed Mail Factory mark become the sole visual focus**, with no unnecessary explanatory text competing with it.

Rule for this section: REMOVE THE TEXT → PRESERVE THE PARTICLE REVEAL → POLISH THE EXISTING 3D → DO NOT DESTROY THE ORIGINAL VISUAL.

The line **“System Architecture & Automation”** is good and should remain. However, the author name **“Atawur Rahman”** **should appear directly after/below this line** as the clear project/creator attribution. Since this is my project, my name should remain visible in the final branding composition, but it should be presented cleanly and professionally—not mixed into unnecessary metadata.

Please also remove the following unnecessary footer/navigation items from this final Brand section:

GitHub
Issues
Project website
Back to top

These links and footer navigation add unnecessary clutter to the final visual and are not required here.

Also remove this entire technical/disclaimer line:

“v1.0.0 · An experimental, educational project. Use only for lawful, authorized and legitimate purposes.”

It does not add meaningful value to the final brand presentation and makes the ending feel like a technical footer rather than a polished final reveal.

Keep the **Mail Factory logo**, **“System Architecture & Automation,”** and **“Atawur Rahman”** as the core branding hierarchy, and make that composition feel clean, premium, memorable, and intentional.

Do not replace the removed content with more unnecessary footer text. Keep the final Brand section minimal and focused.
